Water moves around the world. The movement of water from the **AIR** to the earth and back up again is called the **WATER CYCLE**.

OCEANS contain the most water. This water tastes salty.

EVAPORATION is the movement of water from oceans, **LAKES**, rivers, and the ground into the air. We see water in the air as **CLOUDS** and fog. **WINDS** move the clouds to distant places.

PRECIPITATION falls in the form of **RAIN**, sleet, snow, and hail. If it rains over land water seeps into the ground, or flows down hills and mountains into **RIVERS** and streams. **ANIMALS** drink water from lakes, rivers and underground sources.

As water infiltrates the soil it collects **UNDERGROUND**. This water slowly moves back up to the surface via **CAPILLARY RISE**. Water can also travel to the **SURFACE** via plant roots. Water travels into **PLANT** roots and out of plant leaves.

During winter and when air **TEMPERATURES** are below freezing, we get snow. If it stays very cold this snow does not melt. As snow packs into **ICE** glaciers form. **GLACIERS** hold lots of fresh water. An "Ice Age" is a long period of freezing temperatures. Glaciers traveled into Indiana during the last two Ice Ages.
