# 2013 National Winter Canola Variety Trial

## Objectives

The objectives of the National Winter Canola Variety Trial (NWCVT) are to evaluate the performance of released and experimental varieties, determine where these varieties are best adapted, and increase the visibility of winter canola across the United States. Breeders, marketers, and producers use data collected from the trials to make informed variety selections. The NWCVT is planted at locations in the Great Plains, Midwest, northern U.S., and Southeast.

## Procedures

Seed for the NWCVT was distributed to 41 cooperators in 20 states for the 2012-2013 growing season. The locations receiving seed are illustrated on the map on the front cover. Of the 50 entries tested, 24 were commercial and 26 were experimental. These entries were provided by 11 global seed suppliers. All entries in the trial were treated with either Helix XTra, Prosper FX, or Accelaron seed treatments to control insects and seedling diseases through the late fall and early winter months.

Management guidelines were provided to cooperators, but previous growing experience influenced final management decisions. All trials were planted in small research plots (approximately 100 ft<sup>2</sup>) with three or four replications. Cultural practices, site descriptions, growing conditions, and performance data are provided for each harvested location. Yield results for some locations include 3-year summaries. Results are listed alphabetically by seed supplier.

The Brassica Breeding and Research Program at the University of Idaho performed total oil and protein analysis for all sites using near-infrared spectroscopy. The seed of the Technology Crops International entries was tested internally for oil content.

SGS North America; the USDA-ARS Grassland, Soil, and Water Research Laboratory at Temple, TX; and South Dakota State University at Beresford were new

cooperators in 2012-2013. See the back cover for a listing of participating cooperators.

The NWCVT continues in the 2013-2014 growing season and includes 57 entries. Twelve seed suppliers contributed to the trial, and it was distributed to 46 locations in 22 states.

## 2012-2013 Growing Conditions

Temperature and precipitation data are shown at the top of the page for each location. Thick black lines on the temperature graphs represent long-term average high and low temperatures (°F) for the location. The upper thin line represents actual daily high temperatures, and the lower thin line represents actual daily low temperatures. On the precipitation graph, the line labeled “normal” represents long-term average precipitation, and the line labeled “12-13” represents actual precipitation. If weather information was not provided, data were taken from a nearby town.

In general, the 2012-2013 growing season saw dry conditions at planting and above-normal temperatures throughout the winter months. The spring was challenging because of a slow greenup and late spring freeze events, but ideal weather during grain fill resulted in excellent yields. Overall temperatures were cooler in the northern U.S., thus resulting in winter stand loss.

## Test Sites and Results

Seventeen harvested locations in 12 states are included in this report: Meridianville, AL; Fruita, CO; Griffin, GA; Vincennes, IN; Andale, Belleville, Garden City, and Hutchinson, KS; Princeton, KY; Starkville, MS; Bozeman, MT; Pittstown, NJ; Clovis and Farmington, NM; Springfield, TN; and Orange and Petersburg, VA.

A number of sites, especially in the Great Plains, were affected by devastating drought and late spring freezes. Fifteen locations were not harvested because of drought, hail, poor establishment, or winterkill. Another nine locations were harvested, but the results were not included because the data quality was poor.

KSUR21 had an unknown germination issue, thus poor performance may be reflected.

The “percentage of test average” yield calculation is included in the results. This relative yield calculation allows for some comparison of performance across environments. Entries yielding more than 100 percent of the test average across multiple locations merit some consideration. Regional summary tables were created with data from 2008 to 2013.

Overall, yields were good to excellent where moisture was abundant throughout the growing season. The consistency of yields was excellent, with most sites averaging over 2,000 lb/acre. Yields were above average in the Great Plains and average in the Midwest and southeastern U.S. Twelve sites averaged 2,000 lb/acre, and two sites averaged 3,000 lb/acre. Canola weighs 50 lb/bushel, so a 2,000 lb/acre yield is 40 bushels/acre.

Caution should be used when evaluating data from locations with coefficient of variation (CV) values greater than 20. Lower values suggest less error was observed at the location. Inestimable differences in soil type, weather, and environmental conditions play a part in increasing experimental error and CV values.

### **Variety Selection**

Winter hardiness is an important trait to consider when selecting a winter canola variety. This trait has been improved, but variability still exists where differential winterkill occurs. Winter canola varieties should show consistent survival across multiple years and locations. Other traits to consider include herbicide resistance, tolerance to carryover from sulfonylurea herbicides, maturity, disease tolerance, yield potential, and oil content. Use more than one year of data to make an informed variety selection decision.

Some sites include High Erucic Acid Rapeseed (HEAR). By definition, HEAR is not canola because it produces greater than 2% erucic acid in the processed oil. The harvested seed cannot be mixed with canola grain, and the oil can be used for industrial purposes only. If HEAR is commercially grown, it will be under contract and a delivery point must be identified before planting.

Table 21 provides information on the tolerance of varieties to the blackleg fungus.

View Table 22 for seed sources, brand names, and traits of the winter canola varieties and hybrids grown in the NWCVT.

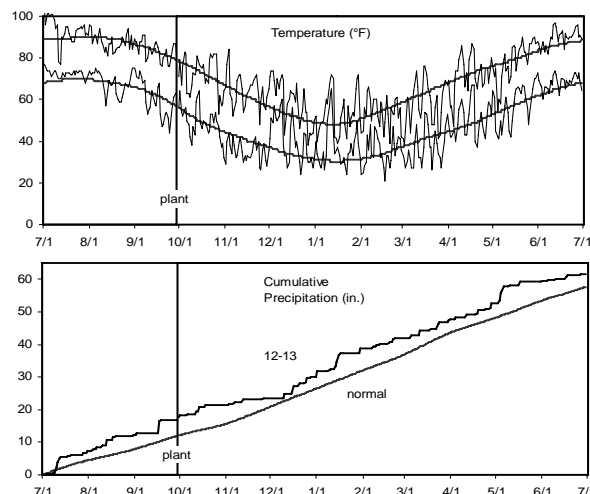

### **Acknowledgments**

This work was funded in part by the Supplemental and Alternative Crops Competitive Grants Program, which is administered by the U. S. Department of Agriculture-National Institute of Food and Agriculture, and the Kansas Agricultural Experiment Station. Assistant scientist Scott Dooley and student workers Emma Gantz, Jessica Martin, and Baylee Showalter assisted with organizing, packaging, planting, harvesting, and data collection. Sincere appreciation is expressed to all participating researchers and seed suppliers who have a vested interest in expanding winter canola acres and increasing production in the U.S.

### Meridianville, Alabama

Ernst Cebert  
Alabama A&M University

Planted: 9/29/2012 at 6 lb/a in 7-in. rows  
Harvested: 6/20/2013  
Herbicides: 2.5 pt/a Trifluralin  
Insecticides: None  
Irrigation: None  
Previous crop: Wheat  
Soil test: NA  
Fertilizer: 50-50-50 lb N-P-K fertilizer in fall  
120-0-0 lb N-P-K fertilizer in spring  
Soil type: Decatur silty clay loam  
Elevation: 624 ft Latitude: 34° 35'N  
Comments: The growing season was mild and precipitation was above normal.

### Starkville, Mississippi

Brian Baldwin and Brett Rushing  
Mississippi State University

Planted: 9/25/2012 at 6 lb/a in 7-in. rows  
 Harvested: 6/20/2013  
 Herbicides: 1.5 pt/a Trifluralin  
 Insecticides: None  
 Irrigation: None  
 Previous crop: Perennial grasses  
 Soil test: NA  
 Fertilizer: 50-0-0-20 lb N-P-K-S fertilizer in fall  
 50-0-0 lb N-P-K fertilizer in spring  
 Soil type: Catalpa silty clay loam  
 Elevation: 333 ft Latitude: 33° 25'N  
 Comments: Difference in drainage and previous  
 crop type contributed to variability in the  
 yield data. Use with caution.

**Bold:** Superior LSD group. Unless two entries differ by more than the LSD, little confidence can be placed in one being superior to the other.

<sup>1</sup>Use yield data with caution. A CV above 20 indicates higher experimental error. Make variety selection decisions based on more than one year's data.

Pittstown, New Jersey

David Lee and Melvin Henninger  
Rutgers University

Planted: 9/25/2012  
Harvested: 7/9/2013  
Herbicides: 1.5 pt/a Triflurex  
Insecticides: None  
Irrigation: None  
Previous crop: Fallow  
Soil test: NA  
Fertilizer: 126-0-0-144 lb N-P-K-S fertilizer in fall  
60-0-0 lb N-P-K fertilizer in spring  
Soil type: Quakertown silt loam  
Elevation: 600 ft Latitude: 40° 33'N  
Comments: Harvest was delayed because of rainy weather, but yields were excellent.

Vincennes, Indiana

Charles Mansfield  
Vincennes University

Planted: 9/20/2012 at 5 lb/a in 6-in. rows  
 Harvested: 7/5/2013  
 Herbicides: 20 oz/a Treflan  
 Fungicides: 8 oz/a Prostaro and 5 oz/a Approach  
 Irrigation: None  
 Previous crop: Watermelon and Tomato  
 Soil test: 41-107 ppm P-K, pH=6.1  
 Fertilizer: 0-0-0 lb N-P-K fertilizer in fall  
 160-0-0-24 lb N-P-K-S fertilizer in spring  
 Soil type: Lomax loam  
 Elevation: 425 ft Latitude: 38° 44'N  
 Comments: Heavy rain delayed fungicide application.  
 Rain from mid-June through early July  
 delayed harvest, reduced test weight  
 and yield, and caused severe lodging.

**Bold:** Superior LSD group. Unless two entries differ by more than the LSD, little confidence can be placed in one being superior to the other.

<sup>1</sup>Use yield data with caution. A CV above 20 indicates higher experimental error. Make variety selection decisions based on more than one year's data.

<sup>2</sup>Yields were adjusted to 10% moisture.

Princeton, Kentucky

Dr. Lloyd Murdock and John James  
University of Kentucky

Planted: 9/21/2012 at 5 lb/a in 7.5-in. rows  
Harvested: 6/19/2013  
Herbicides: 2 pt/a Treflan  
Insecticides: None  
Irrigation: None  
Previous crop: Soybean  
Soil test: 70-196 ppm P-K, pH=6.3  
Fertilizer: 0-40-0-11 lb N-P-K-B fertilizer in fall  
140-0-0 lb N-P-K fertilizer in spring  
Soil type: Pembroke silt loam  
Elevation: 482 ft Latitude: 37° 6'N  
Comments: Normal temperatures and precipitation produced excellent yields.

### Springfield, Tennessee

Dennis West  
University of Tennessee

Planted: 9/26/2012 at 6 lb/a in 7-in. rows  
 Harvested: 6/14/2013  
 Herbicides: 6 oz/a Clethodim and 4 oz/a Stinger  
 Insecticides: None  
 Irrigation: None  
 Previous crop: Wheat and clover  
 Soil test: P=M, K=L, and pH=6.7  
 Fertilizer: 30-0-0 lb N-P-K fertilizer in fall  
 101-0-0-23 lb N-P-K-S fertilizer in spring  
 Soil type: Crider silt loam  
 Elevation: 706 ft Latitude: 36° 32'N  
 Comments: Canola varieties compensated well for variable fall stands.

Data averaged over a 6-year period from 2008-2013.

<sup>1</sup>Number of mean observations, not average value of observations per entry.

### Fruita, Colorado

Calvin Pearson  
Colorado State University

Planted: 8/29/2012 at 5 lb/a in 30-in. rows  
Harvested: 7/3/2013  
Herbicides: 1.5 pt/a Treflan  
Insecticides: None  
Irrigation: None  
Previous crop: Wheat  
Soil test: NA  
Fertilizer: 22-104-0 lb N-P-K fertilizer in fall  
50-0-0 lb N-P-K fertilizer in spring  
Soil type: Youngston fine sandy loam  
Elevation: 4604 ft Latitude: 39° 10'N  
Comments: Temperatures were normal except for mid-December through late January. Precipitation was much below normal.

<b>LSD (0.05)</b>	571	871	---	---	---	---	---	5	1.1	1.3	1.7	2.0

**Bold:** Superior LSD group. Unless two entries differ by more than the LSD, little confidence can be placed in one being superior to the other.

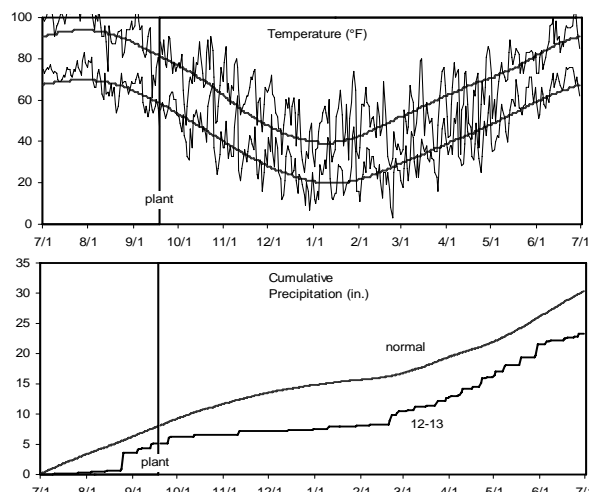

<sup>1</sup>Use yield data with caution. A CV above 20 indicates higher experimental error. Make variety selection decisions based on more than one year's data.

### Andale, Kansas

Brent Gruenbacher and Mike Patry

Planted: 9/18/2012 at 5 lb/a in 9-in. rows  
 Swathed: 6/13/2013  
 Harvested: 6/22/2013  
 Irrigation: None  
 Previous crop: Sorghum  
 Soil test: NA  
 Fertilizer: 36-92-0 lb N-P-K fertilizer in fall  
 73-0-0 lb N-P-K fertilizer in spring  
 Soil type: Blanket silt loam  
 Elevation: 1393 ft Latitude: 37° 47'N  
 Comments: Spotty stands caused by previous crop residue. The canola compensated well and produced excellent yields.

**Bold:** Superior LSD group. Unless two entries differ by more than the LSD, little confidence can be placed in one being superior to the other.

<sup>1</sup> Yields for 2013 were negatively affected by winterkill, multiple late spring freezes, and a thunderstorm on 5/8/2013. Hail and wind damage were even across the plot. The 3-yr. average spans 2010 to 2012.

<sup>2</sup> Winter survival is a visual estimation of the percentage of plants that survived the winter. Ratings were taken 5/8/2013 before the severe thunderstorm.

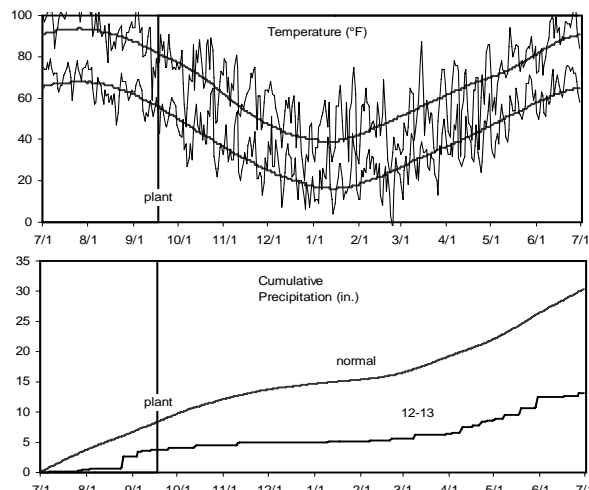

<sup>3</sup> Fall and spring vigor were taken on a scale of 1=least vigorous to 5=most vigorous. Spring vigor was taken on 5/8/2013.

<sup>4</sup> Percentage of viable plants is based on a visual estimation of plants that had survived, resumed active growth, and flowered. It was assumed that these plants would produce harvestable yield before hot temperatures returned to the region. Not all plants that survived the winter were viable.

### Hutchinson, Kansas

Gary Cramer  
Kansas State University

Planted: 9/17/2012 at 5 lb/a in 9-in. rows  
 Swathed: 6/14/2013  
 Harvested: 6/20/2013  
 Herbicides: 1.5 pt/a Treflan and 9 oz/a Assure II  
 Insecticides: None  
 Irrigation: None  
 Previous crop: Wheat  
 Soil test: NA  
 Fertilizer: 50-0-0 lb N-P-K fertilizer in fall  
 75-0-0 lb N-P-K fertilizer in spring  
 Soil type: Funmar-Taver loam  
 Elevation: 1570 ft Latitude: 37° 57'N  
 Comments: The canola responded favorably after late spring freezes. Ideal weather at seed fill resulted in very good yields.

### Clovis, New Mexico

Sangu Angadi and Sultan Begna  
New Mexico State University

Planted: 9/6/2012 at 6 lb/a in 6-in. rows  
 Harvested: 7/3/2013  
 Herbicides: 2 pt/a Treflan HFP and 2 pt/a Prowl H2O  
 Insecticides: Lannite, Baythroid XL, Preveathon,  
 Trimax Pro, Dimethoate, Brigade  
 Irrigation: 23.4 in.  
 Previous crop: Corn  
 Soil test: 29-17-456 ppm N-P-K, pH=7.5  
 Fertilizer: 70-25-0-11 lb N-P-K-S fertilizer in fall  
 Soil type: Olton clay loam  
 Elevation: 4437 ft Latitude: 34° 36'N  
 Comments: Repeated late spring freezes reduced  
 the height of the canola, but yields were  
 excellent in a dry year.

### Farmington, New Mexico

Curtis Owen and Mick O'Neill  
New Mexico State University

Planted: 9/6/2012 at 5 lb/a in 10-in. rows  
Harvested: 7/18/2013  
Herbicides: None  
Insecticides: None  
Irrigation: 24.2 in.  
Previous crop: Potatoes  
Soil test: NA  
Fertilizer: 20-104-120-36 lb N-P-K-S fertilizer in fall  
185-0-0 lb N-P-K fertilizer in spring  
Soil type: Doak sandy loam  
Elevation: 5640 ft Latitude: 36°N  
Comments: Winter survival was poorer in strips where pigweed was not controlled until final disking. Very good yields reported.

<sup>1</sup> Percentage of plants with blackleg.<sup>2</sup> Internal stem decay from blackleg rated on a scale from 0 to 5, where 0 = no disease, 1 = 25% of the stem with decay, 2 = 50% of the stem with decay, 3 = 75% of the stem with decay, 4 = 100% of the stem with decay, 5 = dead plant (from Bradley and Chesrown [2005] Fungicide and Nematicide Reports. 60:FC105. doi:10.1094/FN60).

Blackleg was assessed on the stubble after swathing. Disease incidence and severity were assessed by uprooting plants and examining basal cross sections of 10 stems per plot on 16-May-2013.

Temperatures were above normal (30-yr. average) from November through January, but below normal from January through May. Rainfall was below normal in the fall and mostly above normal from February through April. Over the entire cropping period, rainfall was 15% below normal. Dry conditions in the fall delayed blackleg development, and the leaf spot phase of the disease did not appear until spring 2013. Leaf spots from blackleg became widespread in April during the budding and flowering stages. Blackleg cankers developed on basal areas of most stems near the soil line. Moderate levels were recorded compared with previous trials.
